

Python variables and data types - Lesson overview

Variables and **data types** form the basis of programming in Python. In this lesson, we'll **introduce variables** and explore their use. We'll also **define** the **different data types** and the **operators** that can be used to manipulate them.

By the end of this lesson, you should be comfortable **using and manipulating different data types** stored as **variables**.

Learning objectives

- Define and assign values to variables.
- Understand the different data types used in Python.
- Know how to perform basic operations on different data types.
- Use string formatting to create informative print statements.
